

eNetVario as a control centre with MQTT broker and Node-RED

The operating system (Linux 10, "Buster") and the pre-installed applications have been updated and supplemented.

M2M communication takes place via sockets or the network interfaces using TCP/IP and **MQTT**, or alternatively via a **JSON** REST API.

An **MQTT** broker and the graphical developer platform **Node-RED** are pre-installed and ready to use. The open source software **Node-RED** enables easy graphical programming of your application and is supported by a broad community. A wide range of prefabricated "nodes" are freely available for many

applications.

In conjunction with other **MQTT**-capable devices, such as our remote I/O devices **eNetIO** and **eNetCube**, the **eNetVario** is the ideal control center for industrial automation tasks or your private smart home.

To meet advanced security requirements, the second network interface allows devices to be isolated in separate network segments. By default, access from one network segment to the other is not permitted, true to the motto: "My data belongs to me".

We consider the protection of the network through a firewall and encrypted communication using TLS to be self-evident.

@mkc-gmbh/node-red-mqtt-homie 1.0.1

MKC MQTT HOMIE protocol helper for Node-Red.
